

Aurora Labs – Product Overview

About Aurora Labs

Aurora Labs is a software company founded in 2019 and headquartered in Portland, Oregon. The company employs 400 people and serves customers in 40 countries. Its mission is to make real-time data analytics accessible to teams of every size, from two-person startups to global enterprises with thousands of seats.

The company is bootstrapped and profitable, with annual recurring revenue growing more than 60 percent year over year. Aurora Labs raised a Series A in 2021 led by Northgate Partners and a Series B in 2023 led by Meridian Capital, but the founding team retains majority control and makes product decisions with a long-term horizon. The company operates fully remote with engineering hubs in Portland, Lisbon, and Bangalore.

Products

Atlas is the company's flagship analytics platform. Atlas costs \$49 per user per month and includes real-time dashboards, custom reporting, and a 14-day free trial. It is designed for product and marketing teams that need to turn raw event data into decisions without writing SQL. Atlas connects to web analytics, product analytics, and advertising platforms out of the box, and its drag-and-drop report builder ships with more than 40 chart types.

Atlas Pro is the mid-tier plan. Atlas Pro costs \$99 per user per month and adds single sign-on, audit logs, and priority support. It is intended for growth-stage companies that need compliance-ready access controls and permission groups. Atlas Pro also unlocks versioned dashboards, scheduled email exports, and a 90-day data retention window on the standard plan.

Atlas Enterprise is the top tier. It uses custom pricing based on the number of seats and includes a dedicated support engineer, custom data retention contracts, and deployment in the customer's own cloud account. Enterprise accounts can negotiate annual contracts with volume discounts and receive a 99.95 percent uptime service-level agreement backed by service credits.

Beacon is a lightweight alerting service. Beacon costs \$19 per user per month and integrates directly with Slack and Microsoft Teams. Alerts can be routed by severity, owner, and schedule, and the alert deduplication engine collapses related incidents into a single thread. Beacon supports email, webhook, and SMS delivery channels and can page on-call engineers through PagerDuty.

Beacon Plus is the advanced alerting plan. Beacon Plus costs \$39 per user per month and adds on-call scheduling, escalation policies, and a public status page. It is aimed at SRE and DevOps teams that run production systems around the clock. Beacon Plus includes a 30-day alert history and unlimited integrations.

Nimbus is the company's managed data pipeline product. Nimbus uses custom pricing based on data volume and offers a 99.9% uptime service-level agreement. It connects to over 60 data sources out of the box, including databases, data warehouses, and third-party SaaS APIs, and can stream millions of events per minute into a customer's analytics store.

Nimbus Lite is the entry-level pipeline plan. Nimbus Lite costs \$29 per month for up to 100,000 events per month and includes five data sources and a 14-day data retention window. It is designed for developers who want to try

streaming pipelines without a sales conversation.

Nimbus Enterprise adds private networking, field-level data masking, and a 99.99 percent uptime commitment. It targets regulated industries such as financial services and healthcare that need guaranteed delivery and compliance controls. Nimbus Enterprise includes a named solutions architect and a 24-hour support SLA.

Pricing and Plans

All Aurora Labs products are billed monthly and can be cancelled at any time. Annual billing is available at a 20 percent discount, and all paid plans include unlimited dashboards, unlimited API calls on the standard tier, and email support. Trials do not require a credit card, and trial accounts can convert to paid plans with a single click at the end of the 14-day period.

Volume pricing starts at 50 seats, and enterprise contracts are quoted on an annual basis. Aurora Labs offers non-profit and education discounts of 30 percent, and startup credits of up to \$1,000 for companies that have raised less than \$5 million. All prices are listed in US dollars; international customers are billed in their local currency where supported.

Security and Compliance

Aurora Labs holds a SOC 2 Type II certification and encrypts all customer data at rest with AES-256. The platform is fully GDPR compliant and supports single sign-on through SAML and OAuth. Data in transit is protected with TLS 1.3, and every request is authenticated with short-lived tokens. The security team runs quarterly penetration tests and maintains a public security.txt endpoint and a responsible disclosure program with a 90-day timeline for patching reported vulnerabilities.

Aurora Labs maintains a formal incident response plan and notifies affected customers within 24 hours of a confirmed security incident. Backups are encrypted and stored in a separate region, with a recovery point objective of 15 minutes and a recovery time objective of 4 hours. The company's data processing addendum is available on request, and subprocessors are listed in the privacy policy.

Support

All customers receive 24/7 support with a one-hour response time on the enterprise plan. A community forum and public documentation are available free of charge. Standard plans receive support through a ticketing portal with a four-hour response target during business hours, and Beacon Plus and Atlas Pro customers get priority queue placement and a two-hour target. Enterprise customers are assigned a dedicated support engineer who joins their Slack workspace.

Onboarding and Migration

Aurora Labs offers a guided onboarding program for new customers, including a free implementation workshop for Atlas Enterprise and Nimbus Enterprise accounts. Migration tooling can import dashboards, alerts, and historical data from legacy analytics platforms, and the company publishes a detailed migration guide covering schema mapping and downtime planning. Most customers complete their migration in under two weeks.

Careers

Aurora Labs is hiring across engineering, product, and go-to-market teams. The company publishes a transparent salary band for every role and offers four weeks of paid time off, a home office stipend, and a learning budget of \$2,000 per year. Interview loops include a paid take-home exercise and are designed to finish within two weeks of the first conversation.

Roadmap

The 2026 roadmap includes an AI copilot that answers questions about your dashboards in natural language, a mobile app for Beacon alerting, and expanded warehouse-native integrations. Aurora Labs also plans to ship on-premises editions of Atlas and Nimbus for regulated customers that cannot use the public cloud. Feature requests are tracked publicly, and the roadmap is updated monthly.

Common Questions

Do I need a credit card to try Atlas? No – the 14-day trial requires only a work email address. Can I switch plans mid-cycle? Yes, upgrades take effect immediately and downgrades take effect at the next billing cycle. Is my data portable? Yes, all plans can export raw data and dashboard definitions at any time, and the standard API exposes the full data model.
